

Genea Security + OpenEye

Faster incident verification through real-time access and video intelligence

Security teams often manage access control and video surveillance in separate systems, making it difficult to quickly understand what happened during an incident. Investigations require manual video searches, switching between platforms, and piecing together timelines after the fact.

The OpenEye + Genea Security integration delivers a true two-way experience. Security teams can view video and investigate access activity within Genea, while also managing Genea doors and responding to events directly from the OpenEye platform. The result is faster verification, streamlined operations, and real-time control from either system.

Feature Highlights

Event-driven video verification

Access events automatically surface associated camera footage, enabling faster incident review and reducing time spent manually searching video.

Live video directly from access points

Security operators can view live OpenEye camera feeds tied to Genea doors, allowing immediate visual verification before or during a response.

Smarter investigations, less manual work

By linking identities, access activity, and video evidence, teams can investigate incidents faster and with greater accuracy.

Two-Way Integration

View video and investigate access events in Genea, while unlocking doors and managing activity directly from OpenEye.
